# KLASSE OVERERVING

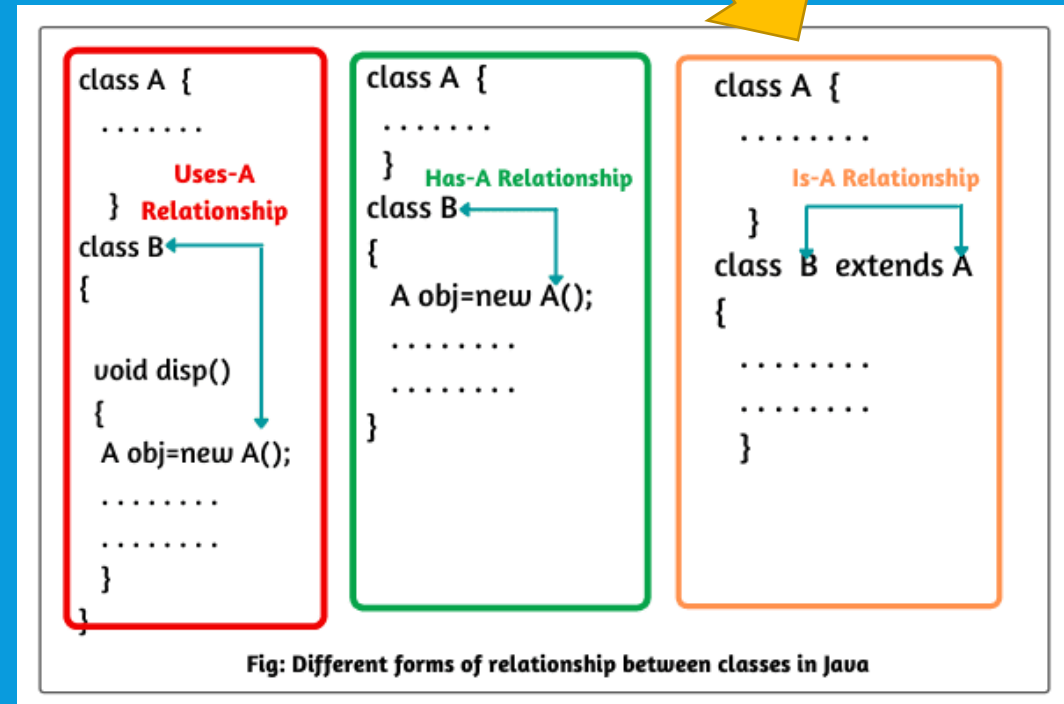

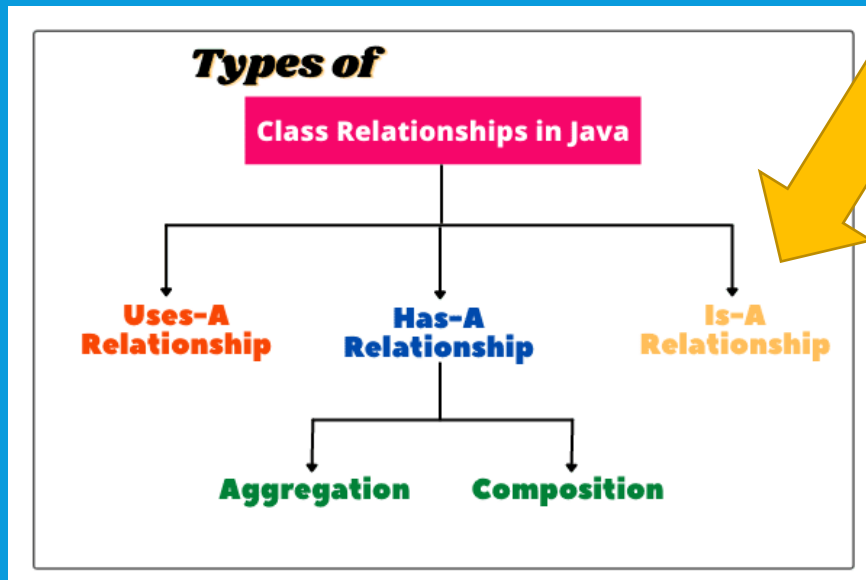

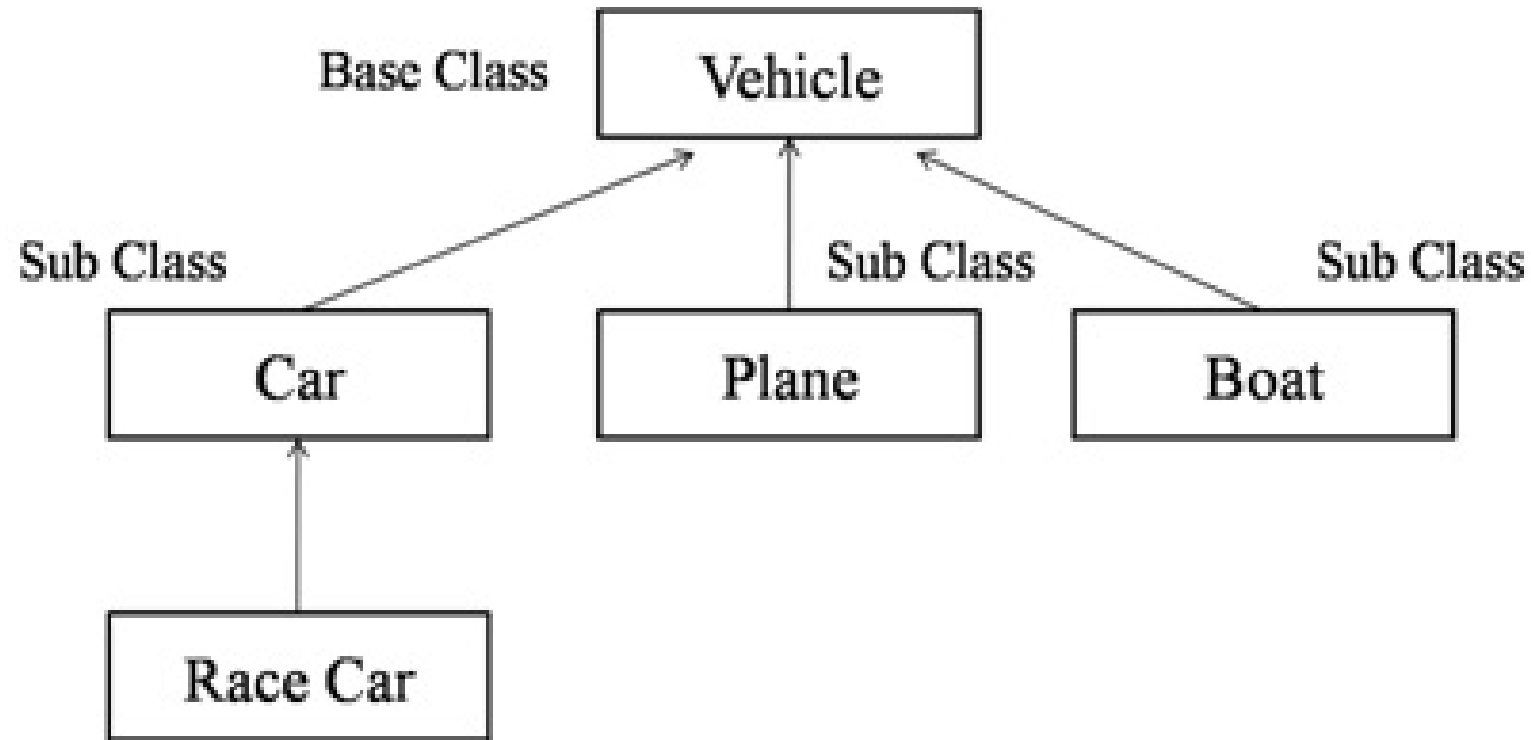

Fig: Different forms of relationship between classes in Java

# WAAROM KLASSE OVERERVING?

*“We gebruiken bijvoorbeeld verschillende voertuigen om ons te verplaatsen. Ze hebben misschien bepaalde eigenschappen of functionaliteit gemeen. Maar ze hebben ook specifieke eigenschappen, zoals kunnen vliegen.*

*Je kunt de gemeenschappelijke eigenschappen en functionaliteiten per klasse apart definiëren, maar dat is weer véél dubbel werk en kan ook weer leiden tot meer fouten. Wat je kunt doen is voor deze klassen een overkoepelende klasse maken die alle eigenschappen en functionaliteiten kan bevatten en waar de onderliggende klassen gebruik van kan maken.”*

# KLASSE OVERERVING

# JAVA INHERITANCE (= OVERLOADING)

```
public class Vehicle {  
    .....  
}  
  
public class Car extends Vehicle {  
    .....  
}  
  
public class Alto extends Car {  
    .....  
}
```

IS-A Relationship

IS-A Relationship

Fig a: Is-A relationship between classes

Fig b: Inheritance hierarchy for Vehicle, Car, and Alto

```
class Dog extends Animal {  
    Dog() {  
        super();  
        ...  
    }  
}  
  
class Animal {  
    Animal() {  
        ...  
    }  
}
```

The diagram illustrates the relationship between the `Dog` and `Animal` classes. The `Dog` class is a subclass of the `Animal` class, as indicated by the `extends` keyword. The `Dog` class has a constructor `Dog()` that calls `super()` to invoke the constructor of the base class `Animal`. The `Animal` class has a constructor `Animal()`. The green line and brackets highlight the flow of control from the `new Dog()` statement to the `Dog()` constructor, and then to the `super()` call, which ultimately invokes the `Animal()` constructor.

SUPER() INVOKES CONSTRUCTOR OF BASE CLASS

# SUBKLASSE INSTANTIE

```
// base class
class Bicycle {
    // the Bicycle class has two fields
    public int gear;
    public int speed;

    // the Bicycle class has one constructor
    public Bicycle(int gear, int speed)
    {
        this.gear = gear;
        this.speed = speed;
    }
}
```

```
// derived class
class MountainBike extends Bicycle {

    // the MountainBike subclass adds one more field
    public int seatHeight;

    // the MountainBike subclass has one constructor
    public MountainBike(int gear, int speed,
                        int startHeight)
    {
        // invoking base-class(Bicycle) constructor
        super(gear, speed);
        seatHeight = startHeight;
    }
}
```

"new MountainBike(...)"

Object van subklasse:

# ABSTRACTE KLASSEN

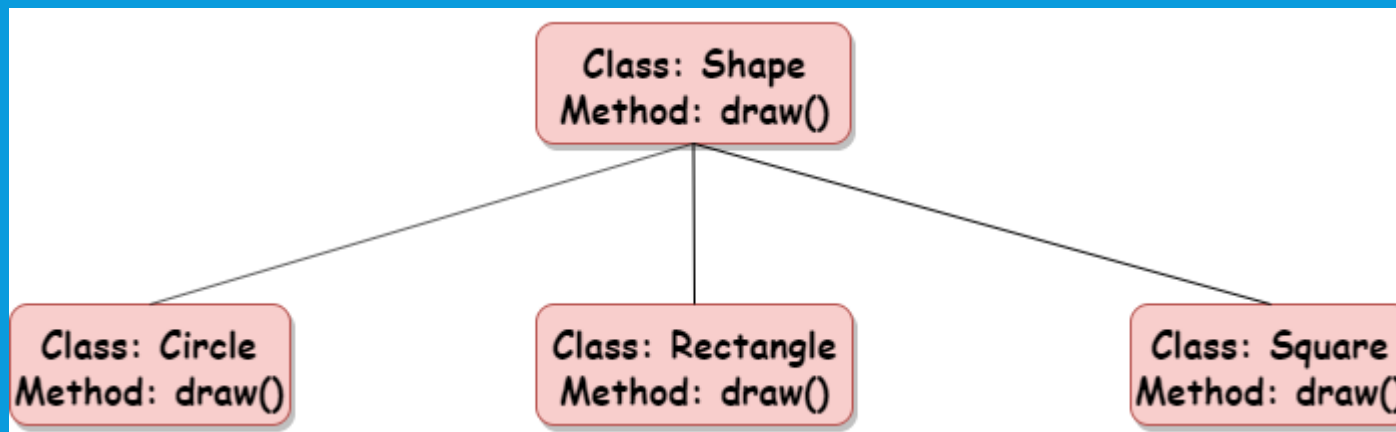

Abstracte klasse kan niet geïntantieerd worden!

(dus `Vehicle v = new Vehicle();` mag niet)

```
public abstract class Vehicle {  
    int posX, posY;  
    float direction;  
    float speed;  
  
    public abstract void drive();  
}  
  
class Car extends Vehicle {  
    @Override  
    public void drive() {  
        System.out.println("Car driving");  
        // ...  
    }  
}
```

# POLYMORFISME

- *"Perform the same action in many different ways"*

# WORKSHOP “SHAPES”

- Wens: tekenen van allerlei vormen, zoals rechthoeken, cirkels, driehoeken etc.
- Gebruik klassen overerving
- Stappen:
  - Technisch ontwerpje maken (in Visual Paradigm)
  - Coderen (in IntelliJ)

# OEFENOPDRACHT "ANIMALS"

Download code van:

<https://github.com/hogeschoolnovi/SD-BE-JP-Overerving-02>

Bestudeer opdracht eisen

Maak base class Animal

Voeg gemeenschappelijke eigenschappen en functies toe

Bedenk klassen structuur (hoeveel lagen gebruik je?)

Maak subclasses

Instantieer objecten van de klassen en roep methods aan.

# HUISWERK

- Maak oefenopdracht “Animals” af
- Bestuderen Java Programmeren EdHub:
  - Hoofdstuk 5: Scope, access modifiers
  - Hoofdstuk 6: Static methods, overloading
  - Hoofdstuk 7: Interfaces
- Experimenteren op W3schools met:
  - Java Scope
  - Java Method Overloading
